

## INTELLISECURE: OPTIMIZED NETWORK SECURITY

*To make sure you  
get the maximum  
level of security  
you need, our  
security experts  
work with you  
to configure  
and deploy the  
right hardware  
and software  
elements for your  
organization.*

Ensuring your network is always operating at top efficiency is only part of the IT puzzle. You must also make sure your organization's most valuable asset — the information and data on your network — is always protected from the legions of cyber criminals bent on infiltrating and corrupting business systems.

Our IntelliSecure service provides tailored, scalable, turnkey managed IT infrastructure security services 24 hours a day, seven days a week. It protects an organization's network and data with firewalls, content filtering, anti-virus, anti-spam, anti-spyware, data management, and intrusion prevention systems.

IntelliSecure ensures your network is always protected from the prying eyes and malicious intent of cyber criminals, from the competition, and even from disgruntled ex-employees.

### Tailor Security to Your Business

IntelliSecure managed security services are tailored to your unique business environment. They allow you to take advantage of the latest security technology and industry standards without the associated infrastructure, management and support costs.

To make sure you get the maximum level of security you need, our security experts work with you to configure and deploy the right hardware and software elements for your organization. Post-deployment, we

provide on-going, pro-active monitoring and maintenance of your security system, make rule changes whenever you request them, and provide recommendations for future additions, upgrades, or enhancements.

### Select from Complete Security Solutions

Our complete IntelliSecure security options are offered as part of three key security service families:

- **Managed Firewall**, which is your first line of defense against the ongoing wave of cyber crime and includes anti-virus, anti-spam, intrusion detection, and content filtering options
- **Data Protection**, which provides disk-based information and data backup solutions and includes automatic, real-time data backup for servers, laptops and PCs
- **Virtual Private Network (VPN)**, which provides secure network links over the public Internet and includes remote access VPN and site-to-site VPN options

### Managed Firewall

With the increase in frequency and sophistication of cyber crime, firewall protection is now essential for all businesses connecting their servers or office networks to the Internet. IntelliSecure Managed Firewall solutions provide secure management and monitoring of your firewall devices at a fraction of the cost of doing it yourself. Our IntelliSecure Managed Firewall services are built on firewall devices from enterprise-

grade, award-winning firewall appliance manufacturers. They offer a number of configuration and service options for:

- **Anti-virus protection**, which secures your network and your e-mail system against viruses, worms, Trojan Horses and the ever-increasing variety of malicious malware
- **Anti-spam protection**, which secures your network from hackers, spam, unauthorized access, phishing, and blacklisting
- **Intrusion detection**, which secures your network from malicious attempts to compromise the confidentiality, integrity or availability of your IT infrastructure
- **Content filtering**, which prevents computer users from viewing inappropriate web sites or content, and protects your infrastructure from access by malware hosts

## Data Protection

To be effective, your business needs constant access to information and data generated by your employees, partners, suppliers and customers. Without that data your business will not be able to operate efficiently and profitably.

Our IntelliSecure Data Protection services are designed to keep your data safe and accessible at all times. They are built on industry-leading backup and recovery solutions, which provide automatic, real-time, tapeless data backup for servers, laptops, and PCs.

With IntelliSecure Data Protection, your information and data files are backed up locally on a regular basis to ensure data can be recovered instantly from any previous point in time. There are no tapes or disks to manage and the solution includes hands-free, automatic off-site backup capabilities to protect your business against disasters. In addition, simple, centralized administration and management features allow our IT experts to monitor and manage your data protection system at all times.

## VPN

IntelliSecure Managed VPN services provide secure communications for remote access VPNs and site-to-site VPNs.

Remote access VPN service allows employees with VPN client software to access resources located behind your corporate firewall from their remote location. The VPN client software creates a "secure tunnel" from the remote machine to the VPN gateway to allow employees to work as if they were sitting at their office computer.

Site-to-site VPN service secures all traffic between two or more office networks each of which is protected with a firewall. This service includes strong encryption and stringent authentication mechanisms to ensure the security of your data.

Both IntelliSecure Managed VPN services include ongoing monitoring, management, and maintenance of all VPN connections.

## Complete Turnkey Solution

With IntelliSecure, you get a complete, turnkey security solution. There is no hardware or software to purchase. You get complete support, including security patches and updates, as required, full hardware replacement, if needed, pro-active security monitoring, and secure, encrypted, remote administration.
